

Feedback

README

Your README provides a clear overview of the repository's content and organization. Well done!

Organization of files

Your data and data preparation scripts are located together in a subfolder, which makes it easy to find them possibly reproduce your analysis. Well done!

Your image files are not located in their own subfolder, which makes it not as easy to distinguish them from the other files and navigate your repository.

Frequent & clear commits

You made frequent commits, ensuring your progress was logged and streamlined. Well done!

You made a good effort to give your commits a clear message, so that someone looking at the repo can understand what your progress was at any given point. Well done!

GitHub Issues

An excellent effort has been made at using issues to identify tasks and assign them among team members!

All files render without errors

All your quarto files render without errors (with the only possible exception being code to load a raw dataset that is >100 Mb that cannot be added to the repository). Well done!

Data preparation

All code used to prepare your data was included in the repository.

Your data preparation file loads the raw file and saves it into a prepared data file, as expected.

Code

Your code was very well organized and styled (using pipes and breaking long code lines made code readable)!

File names

All your file names followed the tidyverse style (i.e., do not include spaces, symbols other than underscores, capital letters..)
